

What is Linux?

- Linux is a clone of Unix operating system
- Unix is paid software

Shell

- a program that accepts and interprets commands
- provides an interface to the system
- the shell is configured for each individual user

Kernel

- Hardware control software
- Libraries/utilities that let users interact with hardware
- Manages resources - CPU, memory, storage, I/O devices

Distro

- Linux OS is available in many different distributions
- They are collections of a specific kernel with different support programs
