

Packages

Libraries

Software that be used by many different programs

Package Management

Relates to programs (*processes*) on your computer

Two main package management systems:

1. RPM (RedHat Package manager)
2. DEB (Debian)

You can't install a RPM package on a Debian system and vice versa

Package

once installed, consist of files on you computer

Database

contains info about installed files

Dependencies

libraries that a package requires

Binary Package Creating

download course code and using tools create a binary package

can install the package

Dependency conflicts

Dependency problems

- Missing libraries/support packages
- Incompatible libraries - wrong version
- Duplicate libraries
- Mismatched name - same libraries but different name

Workarounds

- forcing the installation
with `dpkg --ignore-depends=package --force-depends --force-conflicts`
- upgrading, downgrading or replacing the dependency
- rebuilding the package -

RPM to Debian

alien lets you convert between RPM and Debian packages

- requires you have both RPM and Debian package managers
- having another package manager isn't a problem as long as you don't use it

alien

`alien [options] file[...]`

option	
--to-deb	
--to-rpm	
--to-tgz	convert to tarball format
